The sequence is that encoding an M845 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably M845), which encodes a product selected from auxins, rolls and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile New nucleic acid encoding a - useful in mediating plant Claim 3; Page 23-24; 39pp; English. M845 male tissue-preferred regulatory region fertility, especially hybrid seed production

infertile plants

The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the M945 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The

ogenous gene ession of the provided. The

The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue-preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably
                                                                                                                                                                                                                               New nucleic acid encoding a Ms45 male tissue-preferred regulatory region - useful in mediating plant fertility, especially hybrid seed production.

The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a

of.

The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expension.
                                                                                                                                                                                      A male tissue-preferred regulatory region essential for initiating transcription of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a Z. mays Ms45 promoter fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                            13-FEB-2001; 2001WO-US004527

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (S1). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web

ADR04296
                               The present invention describes an isolated polynucleotide comprising a first, second, third, fourth or fifth nucleotide sequence, or their complement encoding a polypeptide either having flowering locus T gene CC (FT), terminal flower (TFL), or Apetala3 (Ap3) homologue activity. Also construct comprising the polynucleotide; (3) transforming a cell by transforming a cell with the polynucleotide; (3) transforming a cell by transforming a cell with the polynucleotide; (4) a cell comprising the comprising the comprising transforming transformed plant cell; (5) producing a plant comprising transforming construct; (7) a seed comprising the recombinant DNA construct; (6) a plant comprising the recombinant DNA construct; (7) a seed comprising the recombinant DNA construct; (8) an construct; (9) an seed comprising a first nucleotide sequence, where the first nucleotide sequence is comprising a first nucleotide, where the construct polynucleotide includes the second, third, fourth, fifth or construct polynucleotide includes the second, third, fourth, fifth or construct polynucleotide includes the second, third, fourth, fifth or constaining a recombinant DNA construct comprising a polypeptide concoded by the polynucleotide comprising isolating the polynucleotide concoded by the polynucleotide comprising isolating the polypeptide from a cell containing a recombinant DNA construct comprising the polynucleotide sequence (concoded by the polynucleotide comprising isolating the polypeptide from a cell containing a recombinant DNA construct comprising the polynucleotide sequence concoded by the polynucleotide sequence are repulsed polynucleotide are useful contained to the construct comprision to explant the construct comprision to enhance concoded the construct comprision to enhance construct construct constructs and tissue concoded the construct constructs and tissue construct constructs and tissue constructs and the sequence represents an FT homologue construct.
  Sequence 13400
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 6; SEQ ID NO 63; 109pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Danilevskaya O, Her

The present sequence represents the P-Ztap promoter of maize. It is used CC in the method of the invention. The specification describes a method for the production of male sterile plants. The method comprises selective expression of DNA encoding a protein that causes tolerance to glyphosate and application of glyphosate. The method uses two DNA molecules, each coperably linked to a separate promoter, whereby the first promoter functions in plant cells to produce a protein that causes tolerance to glyphosate, and the second promoter functions in plant cells to cause the production of a second RNA sequence in a male reproductive tissue. Expression of the DNA promotes tolerance to glyphosate in those tissues in which it is expressed. Expression of the second DNA molecule causes to the production of an RNA sequence which can inhibit the glyphosate commoter for the second DNA molecule which can inhibit the glyphosate commoter for the second DNA molecule which restricts the production of the antisense RNA to only a subset of the tissues which express the first DNA molecule, only the subset of the tissues which express the first DNA molecule, only the subset of the tissues which express the first considered will be susceptible to glyphosate toxicity. In this way, a specific cell type or combination of cell types, depending upon the component of the plant. The methods can be used for production male-sterile plants for use in the production of hybrid seed, for minimizing undesirable crop outcrossing, and for lengthening flower life. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S

                                                                                                                                                                                                                                                                                                                                                    CC This is the nucleotide sequence of the maize gene dull1 (dul). To CC illustrate the role of the dul locus in starch biosynthesis, a transposon CC tagging strategy was used to isolate the gene and describe its CC polypeptide product. The invention reports tagging of the dul locus with CC polypeptide product. The invention reports tagging of the dul locus with CC untransposon, cloning and characterisation of a portion of the gene, and isolation a near full-length cDNA (the present sequence). The amino acid CC sequence (see AAY06199) deduced from this cDNA indicates that Dul codes CC for a 186 kDa protein extremely similar to potato tuber starch synthase CC for a 186 kDa protein extremely similar to potato tuber starch synthase CC endosperm. The Dul product contains unique sequence features in its N-CC terminus that may mediate direct interactions with other starch biosynthetic enzymes. Mutations within the maize SSII gene affect CC totosynthetic enzymes. Mutations within the maize SSII gene affect CC unitains grarch synthase(s), starch branching enzyme (s) and possibly CC containing starch synthase(s), starch branching enzyme (s) and possibly CC containing starch synthase(s). The isolated cDNA can be used to provide an enzyme with which to regulate the production of starch, and with which to produce altered or novel forms of starch, e.g. in transgenic plants. Cx production. Claimed expression vectors comprise the cDNA or fragments of it that code for functional portions of DUI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an isolated DNA molecule encoding a fusion CC protein consisting of 4 different functional domains selected from glucan CC association domain (GLASS), linker domain (LLNKR), glucosyl transferase CC domain (GLYTR), and C-terminal end (CTEND) which are operably linked to CC one another. The DNA molecule is useful for expressing in plants CC polypeptides including starch synthase enzymes as fusion proteins with CC improved affinity to starch synthase enzymes as fusion proteins with CC compared to plants producing native starch conditied lengths CC as compared to plants producing native starch or starch produced with CC compared to plants producing native starch synthase fusion CC proteins along with granule bound starch synthase fusion CC modified starch having an altered or improved morphology, retrogradation, CC waterbinding, or swelling potential of the granules, gel strength, CC adhesiveness, cohesiveness, hardness, elasticity, increased or decreased CC granule size, degree of branching, crystallinity, degree of cross-cCC linking, and increased or decreased glucan chain lengths. This sequence crockes a starch synthase used in the invention

The DUI polypeptide has starch synthase activity, and comprises an N-terminal arm region, a C-terminal catalytic region, and a region of about 900 amino acids terminating with the catalytic region. The C-terminal catalytic region has a catalytic domain comprising alpha-1,4-glycosyltransferase catalytic activity. The dul polymucleotide sequence is useful in producing starch e.g. from a transgenic plant or transfected cell. The present sequence encodes maize

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC lactation or muscle and fat deposition (designated LMFD), derived from CC cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, (2) appearing as ABX34836-ABX49947, or complements of them. Also included are (2) (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid intended to a promoter and a 3' non- translated sequence that (2) determining a level or pattern of a molecule in a bovine cell or (2) determining a level or pattern of a molecule in a bovine cell or (2) determining (a) incubating a marker nucleic acid (comprising any of the 1512 nucleic acid molecule obtained from the bovine cell or (2) determining a level or pattern of a molecule in a bovine cell or (3) detecting the level or pattern of the complement or fragment) with a (3) complementary nucleic acid molecule obtained from the bovine cell or (4) tissue, where hybridisation between the marker nucleic acid and the (5) detecting the level or pattern of the complementary nucleic acid is used for (5) detecting the level or pattern of the complementary nucleic acid is used for (5) detecting the level or pattern of a molecule in a bovine cell or the detection of the molecule. The LMFD nucleic acid is used for (5) determining a level or pattern of a molecule in a bovine cell or tissue. (6) tissue useful for genome mapping, gene identification and analysis, cattle breadth of the molecule in a bovine cell or tissue. (7) for genetically improving cattle for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the present sequence was not shown in the specification but was obtained in celectronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches 134;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 3, Application US/08410784A

Patent No. 5912413

GENERAL INFORMATION:
APPLICANT: MYERS, ALAN M.
APPLICANT: JAMES, MARTHA G.
TITLE OF INVENTION: ENZYME, THE PRODUCT OF THE MAIZE GENE
TITLE OF INVENTION: SUGARY 1

NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
ADDRESSE: Weingarten, Schurgin, Gagnebin and Hayes LLP
STREET: Ten Post Office Square
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CURRENT APPLICATION NUMBER: US/09/554,467A
CURRENT FILING DATE: 2000-05-12
PRIOR APPLICATION NUMBER: PCT/US98/24225

Patent No. 6617109

Patent No. 6617109

GENERAL INFORMATION:

APPLICANT: Xu, Jiangchun

APPLICANT: Xu, Jiangchun

APPLICANT: Scolk, John A.

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE

TITLE OF INVENTION: THERAPY AND DIAGNOSIS OF OVARIAN CAN

FILE REFERENCE: 210121.484C4

CURRENT APPLICATION UMMBER: US/09/713,550

CURRENT FILING DATE: 2000-11-14

NUMBER OF SEQ ID NOS: 205
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       В

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Vers

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/880,499

FILING DATE: CONCURRENTLY HEREWITH

CLASSIFICATION: 800

ATTORNEY/AGENT INFORMATION:

NAME: Sweeney, Patricia A.

REGISTRATION NUMBER: 32,733

REFERENCE/DOCKET NUMBER: 0578

TELECOMMUNICATION INFORMATION:

TELEPAX: (515) 248-4800

TELEFPAX: (515) 248-4844

INFORMATION FOR SEQ ID NO: 1:

SEQUENCE CHARACTERISTICS:

LENGTH: 1394 base pairs

TYPE: nucleic acid

STRANDEDNESS: single

TOPOLOGY: linear

MOLECULE TYPE: DNA (genomic)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 16073, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

FILE REFERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

CURRENT FILING DATE: 2000-04-14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Patent No. 6605709
